

## The Mars RT Pro Convertible Series On-Line UPS – Your One-Stop UPS Solution

### *VPS introduces one of the most reliable Power systems on the market*

In today's technology-reliant business world, a UPS system has become synonymous with safety and power protection. Choosing the right UPS for your company is vital; if you do not have the correct power protection you are putting your business at the risk of downtime, lost data and component failures.

The fundamental factors governing today's businesses are cost, efficiency, flexibility, and in recent times, concern for the environment. To address these concerns, Value Power Systems (VPS), an ISO9001 accredited value-added distributor based in Shropshire, is exclusively offering The Mars RT Pro Convertible Series On-Line UPS 1-3KVA.

The MP Series is the ideal UPS system for Servers, Networks, Storage, Telecommunications and Industrial Equipment. It can be used in a variety of industries such as the IT, Telecommunications, Industrial, Marine, and Medical market.

VPS specialises in providing power protection for both computers and telecommunications. As the main agent for AblereX in the UK, they are the sole importer of the Mars Convertible Series. With over 50 years combined experience, they offer expert advice and solutions for even the most complex requirements. VPS rigorously examined the quality, effectiveness and efficiency of the Mars RT Pro, and assessed its reception in the overseas marketplace, before adding it to their extensive product range, ensuring that you make the most informed choice.

The VFI-classed Mars RT Pro is one of the most adaptable UPS systems on the market. Its convertible format allows it to be used as a tower, or set in a 19" rack. The RT series also offers a longer runtime, as well as an EPO (Emergency Power Offer), unlike most conventional 1-3KVA UPS systems.

The Mars RT Pro is one of the most user-friendly systems on the market. Its clear LCD display offers a welcome alternative to the traditional LED, displaying real-time status and parameter readings, including AC Input and Output Voltage, Frequency, Battery Voltage, Load Level, and UPS temperature.

The system is also much more energy-efficient than the traditional UPS; using the eco mode, up to 97% efficiency can be achieved, which helps address the environmental concerns facing many businesses.

With programmable sockets, the Mars RT Pro allows you power multiple devices, i.e. computers and telephone systems, and also enables you to turn off less critical devices in the event of a power failure.

The system incorporates intelligent self-diagnostics with the DSP control; this systematically checks each component, and displays the fault on the LCD Display. What is perhaps most unique about the Mars Convertible Series is that it can diagnosis and display problems that would slip under the radar of many UPS systems, allowing service technicians to pinpoint and quickly repair the UPS.

The Mars RT Pro comes with a full range of accessories, without any additional cost, offering a one-stop solution for your UPS requirements.
